

Data Quality Findings Report

- Submit a written Data Quality Findings Report as a file in your GitHub repository
- The report must list every data quality issue you discovered in the source file
- For each issue, document: what the problem is, how many records are affected, and what decision you made to resolve it
- This report demonstrates your ability to think critically about data before building on it

1. Transaction_Date

- The data is not in the same date format thus has to be standardized to one format.

2.Payment Method

- The data is clean thus nothing has to be done

3.Cashier_Name

- The data contains duplicates which we don't have to clean as one cashier can process multiple transactions. We just have to check if there are no duplicate transactions

4.Transaction_Amount

- The data contains negatives and is not in the same data types. Thus i have to choose whether the data should be a float or an integer, then investigate if the negatives should be there or not

5.Transaction_Discount

- Data looks clean

6.Customer_first_name, customer_last_name

- Data contains empty spaces(nulls)
- Data also has mixed uppercase and lowercase text

7. Customer_email, customer_city, customer province, customer_phone, customer_loyalty tier, customer_since

- Data contains empty spaces(nulls)

8. Unit_price, cost_price, Line_amount

- The data is not in the same data type so should be standardized to one data type
-

9.product_name, category, sub_category, sku,

- Data looks clean

10. Store_name, store_manager, store_city, store_province, store region

- Data looks clean

11. supplier, qty, stock_on_hold, reorder_threshold

- Data looks clean
